About Radhika Constructions

A multidisciplinary approach combining construction, surveying and project documentation.

Construction & Survey Work

Radhika Constructions is engaged in construction-related activities together with professional survey work. Surveying forms an important base for understanding site conditions, measurements and project requirements.

DPR Preparation

The firm prepares Detailed Project Reports (DPRs) for different projects. DPR preparation brings together project requirements, site information, planning considerations and supporting documentation.

Water & Watershed Projects

A major part of the work is connected with watershed development and water conservation, with projects primarily undertaken at the village and Tehsil level.

Construction & Survey Work

Surveying and project-related field information provide the foundation for informed planning.

Site Understanding

Survey work helps establish an understanding of the site, its physical conditions and the requirements that need to be considered before project planning.

Planning Support

Survey information supports project planning by providing a practical reference for proposed works, site conditions and development requirements.

Measurement & Documentation

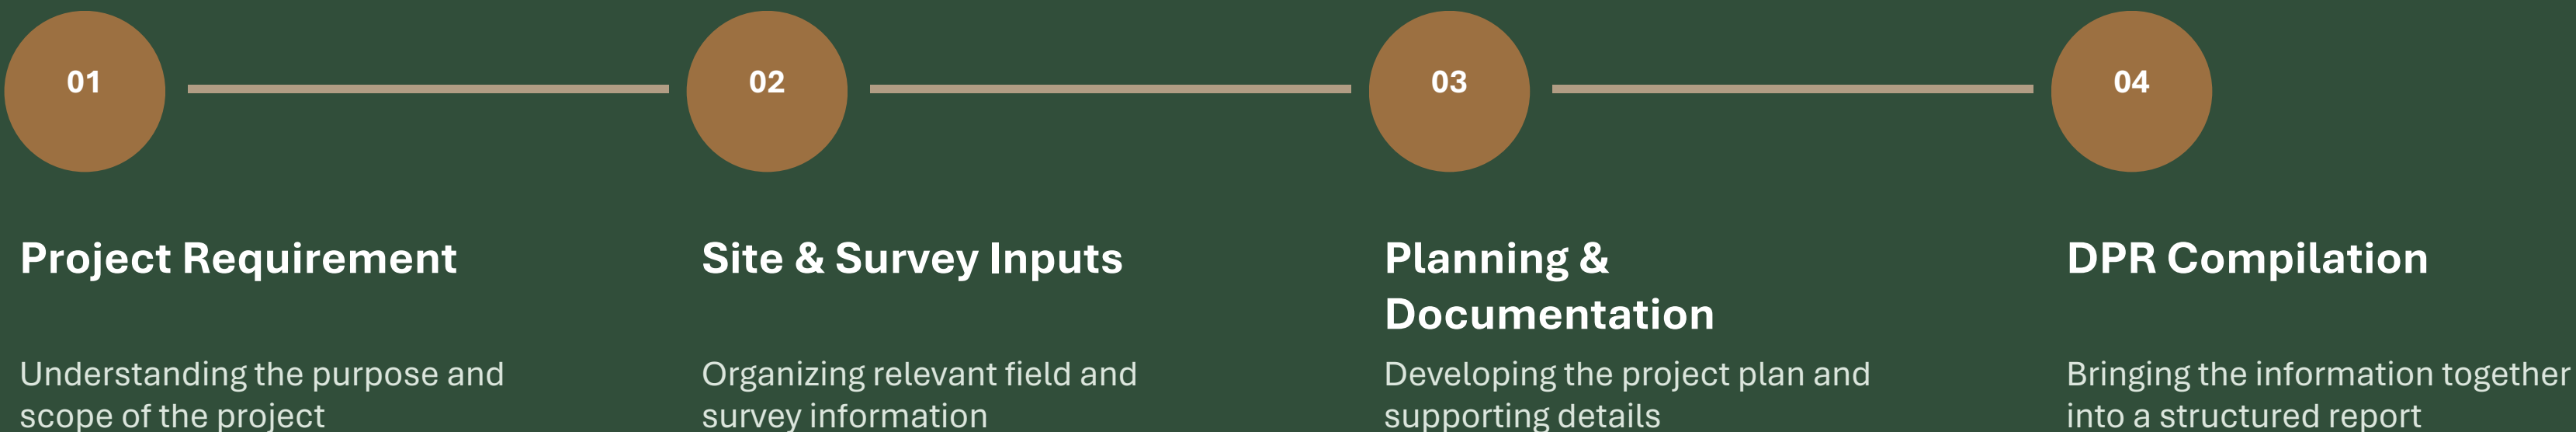

Field measurements and survey information can be organized into drawings, plans and supporting project documentation according to the requirements of the assignment.

Integrated Approach

Construction-related understanding and surveying are brought together to support the preparation and development of project proposals and reports.

Detailed Project Reports (DPR)

A structured document that brings project requirements, site information and planning details together.

The objective is to present project information in a clear, organized and usable form for further planning and project-related processes.

Watershed Development

A major area of work focused on planning and development activities related to watershed areas.

Understanding the Watershed

Watershed-related projects begin with understanding the local area, drainage characteristics, water-related needs and the broader development context.

Planning & Development

Project planning considers the requirements of the area and the proposed development activities, supported by survey information and detailed project documentation.

Local-Level Focus

These projects are mainly carried out at the village and Tehsil level, where local conditions and practical requirements are central to project planning.

Water Conservation

Supporting planned and sustainable use of local water resources.

Water Resource Planning

Water conservation projects involve planning activities that address local water needs and the management of available resources.

Village-Level Context

At the village level, project requirements are closely connected with local land, water and community conditions.

Conservation-Oriented Development

Project planning can support measures intended to improve water availability, retention and responsible use according to local requirements.

Tehsil-Level Projects

Tehsil-level work brings together project planning and documentation for larger administrative or geographic areas.

Our Integrated Project Approach

Connecting field information, technical documentation and development planning.

- 1

Survey

Collect and organize relevant site information.
- 2

Assessment

Understand project requirements and local conditions.
- 3

Planning

Develop the proposed approach based on available information.
- 4

DPR

Prepare a structured Detailed Project Report.
- 5

Development

Support project-related activities at the relevant level.

Project Implementation Levels

Our watershed and water conservation work is primarily associated with local administrative levels.

Village Level

Projects at the village level are closely connected with local site conditions, water-related requirements and the practical needs of the area.

Survey inputs and project documentation help translate local requirements into structured project proposals.

Tehsil Level

Tehsil-level projects address requirements across a broader local administrative area.

Detailed planning and DPR preparation help organize project information and proposed development activities at this level.

What Our Work Brings Together

Technical Understanding

Construction and surveying knowledge

Structured Documentation

Detailed Project Reports and supporting information

Water-Focused Development

Watershed development and water conservation

Local Project Context

Village and Tehsil-level project requirements
